## THRIPS

All glad bulbs should be disinfected as thrips or their eggs may be destroyed easily by the following methods:

Napthalene flakes scattered among the bulbs, 1 oz. to each 100 bulbs, covering bulbs with heavy papers or enclosing in tight paper bags. This should be done after bulbs are cured (five or six weeks after digging). Allow flakes to remain three weeks and then remove bulbs and keep in cool temperature, 5 or 10 above freezing.

Fumigation can be done three or four weeks before planting, providing bulbs are stored in cool place during the winter.

Soaking should be done just prior to planting. Any of the following solutions help prevent disease and also destroy bugs and eggs:

Bichloride of Mercury, ½ oz. to 4 gals. water, soak three hours.

Common lye, 1 can to 20 gals., or one tablespoon to each gallon of water, soak six to eight hours.

Dissolve ingredients in a little hot water then mix well in cold water.

The above should not be used in metal containers as they corrode metal.

Spraying may be done with following: 2 lbs. brown sugar, 2 tablespoons paris green, 3 gals. water. Spray when plants are 1 ft. high and once weekly until buds appear.

Our bulbs are disinfected, and be sure yours are.
